NETC 170 – IT Governance & Management

Module Four Assignment

Most Popular IT Governance Frameworks

We read about three popular IT Governance Frameworks this week: NIST CSF 2.0, ISO 27001, and COBIT. All three have strengths and characteristics that appeal to different types of organizations. They also work well together, allowing organizations to create comprehensive solutions for risk management, cybersecurity compliance, and IT governance. The table below shares a description, geopolitical purview, and best qualities of each of these frameworks:

Governance Framework	Description	Geopolitical Purview	Best Quality
NIST CSF 2.0	A cybersecurity-focused framework with 6 core components, each of which has functions and subcategories to organize a comprehensive approach to IT Governance and Risk Management	Voluntary framework created by NIST, a US-based government agency; it has a US focus that is compliant with some US regulations and laws, but its broad appeal has led to some use abroad	Well-organized, color-coded, and structured while retaining flexibility; strong focus on cybersecurity; vendor and technology neutral, applicable in any industry
ISO 27001	An international standard that provides specifications for an information security management system that is technology and vendor neutral, applicable for any business	International standard used worldwide, comes with a paid certification for organizations from ISO recognized internationally	Comes with a verified certification from ISO; provides controls and rules to follow; requires constant improvement to certify and re-certify
COBIT	An IT Governance framework meant to be generic, comprehensive, and flexible to be used by all enterprises; has the goal of providing a common language for IT professionals, compliance auditors, and business executives, aligning IT with business goals and outcomes	An adaptable framework created by ISACA, COBIT originated in the US but is used internationally and can be combined with other frameworks to comply with local/international regulations	Strong focus on aligning IT and business, defining best practices, and providing a common language between IT and business management; applicable to any industry and company
