NETC 170 – IT Governance & Management

Module Nine Assignment

Business Continuity Management and Resiliency

An important component of IT Governance and Management is the resiliency of a business and the management practices for business continuity. Though similar in nature, there are some distinct differences between these two management practices. The table below shares a short description of each and includes some benefits and challenges for each practice as well.

Aspect	Disaster Recovery Planning (example)	Business Continuity Management	Business Resilience
Description	Focuses on restoring IT systems and data <i>after</i> a disruption.	The proactive planning and subsequent capability of an organization to keep essential operations running <i>during</i> a disruption.	The ability of an organization to absorb stress, recover critical functionality, and thrive in altered or disruptive circumstances.
Benefits	• Minimizes downtime and data loss. • Ensures rapid IT recovery. • Protects critical data.	• Keeps essential operations running during crises • Enhances consumer and shareholder confidence • Aligns with standards and regulations	• Encourages long-term adaptability and agility • Can increase competitive advantage over other companies • Improves ability to weather future unknowns
Challenges	• Complex and time-consuming to develop. • Requires frequent updates.	• Only works if departments work well together • Requires regular testing • May be resource-intensive to maintain	• Requires continuous improvement • Difficult to quantify or measure • Needs support and buy-in at all levels
