Lab 13 – 4-16-2025

## Part 1 – Intune Configurations

### 1. Open <https://intune.microsoft.com/>

Successfully logged into Intune with my F3 ‘student 6’ account.

- Go to Groups>All groups>click “New group”.**
- In the New Group page: Select Group type “Security”>Enter a group name for your user group>select Membership type “Assigned”.**

Above you can see that a new Security group with my last name of type Assigned is being created.

- Under the Members heading search for your E5 user account>Click on the user in the list to highlight it with a blue checkmark
- Click the blue “Select” button.
- Click Create the policy

Under ‘Add Members’, I have looked for my E5 account and clicked the blue checkmark.

After adding myself to the group, I clicked Create (above). I searched my name to confirm that the group was created (below).

## 2. Create a compliance policy for Windows devices.

### a. Go to Devices>Windows>Compliance policies>click “Create policy”.

I navigated to Devices/Windows/Compliance and clicked ‘Create a policy’

### b. In the side window: Select platform>Windows 10 and later>click the blue “Create” button.

### c. In Basics: Enter a name for the policy>click “Next”.

Here I have selected Windows 10 or later and named the policy with my last name.

d. In Compliance settings, under Device Properties: Click “+ Add settings”

e. Set a minimum OS version that will allow your device to be compliant

Microsoft Intune admin center

de Legarreta Device Group

Here I am adding the device group I created earlier.

h. In Review + Create: Click “Create”.

Here is the created policy – you can see its properties above.

### 3. Rename your PC, name to your last name. Enroll your device into Intune.

Here you can see that my E5 is logged into the VM. It's worth noting that having a fully set up VM and then adding the school account did NOT work. I had to create a NEW VM and ensure in its set up that I logged into my work or school account DURING the

installation. The lab instruction about going to Accounts -> Add a work or school account -> Connect did NOT work for me. After creating this new VM, it automatically enrolled into Intune.

You can see the device in Intune on my User and that it's connected to Microsoft Intune.

And reviewing 'Devices' in Intune shows that my device is present and that it is compliant with the Compliance policy!

#### 4. Add the Microsoft 365 app suite.

a. Go to Apps>Windows>click "Add".

b. Select app type>Windows 10 and later>click the blue "Select" button.

Here I am adding the MS 365 apps for Windows 10 and later.

- c. In App suite information: Modify the Suite Name to match the naming convention of the lab>leave the default description>Select a category if desired>click “Next”.

The screenshot shows the 'Add Microsoft 365 Apps' page in the Microsoft Intune admin center. The breadcrumb trail is 'Home > Apps | Windows > Windows | Windows apps'. The page title is 'Add Microsoft 365 Apps' with a subtitle 'Microsoft 365 Apps (Windows 10 and later)'. The progress bar shows four steps: 1. App suite information (active), 2. Configure app suite, 3. Assignments, and 4. Review + create. In the 'App suite information' section, the 'Suite Name' field is set to 'de\_Legarreta\_Lab\_13'. The 'Description' field contains the default text 'Microsoft 365 Apps for Windows 10 and later'. A preview of the description is shown below the field.

I changed the suite name to my last name + Lab 13.

- d. In Configure app suite: Ensure the Excel, Outlook, PowerPoint, Teams, and Word office apps are selected.

The screenshot shows the 'Add Microsoft 365 Apps' page in the Microsoft Intune admin center, specifically the 'Configure app suite' step. The breadcrumb trail is 'Home > Apps | Windows > Windows | Windows apps'. The page title is 'Add Microsoft 365 Apps' with a subtitle 'Microsoft 365 Apps (Windows 10 and later)'. The progress bar shows four steps: 1. App suite information, 2. Configure app suite (active), 3. Assignments, and 4. Review + create. In the 'Configure app suite' section, the 'Configuration settings format' is set to 'Configuration designer'. Under 'Configure app suite', there are two sections: 'Select Office apps' and 'Select other Office apps (license required)'. The 'Select Office apps' section shows a list of Office apps with checkboxes. The 'App suite information' section shows 'These settings apply to all apps you have selected'. The 'Architecture' field is set to 'x64'. The 'Default file format' field is set to 'Office Open XML'. The 'Update channel' field is set to 'Current'. The 'Remove other versions' checkbox is unchecked.

Here you can see the five apps (Excel, Outlook, PowerPoint, Teams, and Word) are selected for this configuration.

- e. **Make sure you select 64-bit architecture.**
- f. **The default file format should be “Office Open Document Format”.**

64-bit architecture is selected in the configuration and the default file format is “Office Open Document Format”.

- g. **Click on “No languages selected”>select “English”> click “OK”. Click “Next”.**

Above you can see that I selected ‘English’ as a language.

- h. **In Assignments: Click “Add groups”>search for your user group and click on it>click “Select”>click “Next”.**

I have added my Device group to the configuration.

i. In Review + Create: Click “Create”.

Here is the created App configuration.

Here you can see that, after marination, the device has installed the MS365 software.

Above is a screenshot with Outlook started for the first time, populated with my E5 account.

Here is Microsoft Excel installed and signed into my account.

Here is PowerPoint, logged in with my user account.

Here is Word installed and logged into my account.

Our E5 does not have Teams, so it's offering me a trial. You can see that it's installed and that I'm signed in, however, given the 'Sign Out' option.

5. **Add another app and assign it to your device group. Select the "Microsoft Store app (new)" app type. You can find a free app in the Microsoft Store on any up-to-date Windows device. At this point in the lab, you should be able to configure and deploy the app on your own, so you won't receive further instructions.**

I have chosen to add the DuckDuckGo Browser.

Microsoft Intune admin center

After some marination, you can see that the browser is installed on the VM as indicated by Intune.

And here is the browser open on the VM!

## Part 2.

1. Log into your F3 account
2. Use your E5 account to disable the F3 account and Revoke all sessions

I don't have access to Entra or Intune with my E5, but I do have access with my F3 (below):

So I will use my F3 account to disable and revoke the sessions for my E5 account instead.

So it turns out that I can't use my F3 account to revoke the sessions or disable my E5 account, but weirdly I CAN use my F3 account to disable and revoke sessions for the F3 account itself.

I will therefore demonstrate how to block sign in attempts and then revoke all sessions for the F3 account.

In Intune (or Entra), you click on Users -> All users and then select the user you want to block and revoke sessions.

Once you are at the user's page, you select 'Edit properties' in the Overview tab.

Under the 'Settings' tab, you can see the 'Account enabled' is checked. You would uncheck that to disable an account and block their future sign ins. I imagine that an account can't disable itself, so the option is not available to me.

If you navigate back to the overview for the user, you can see along the menu the revoke sessions button. If you click it, you will see the message below:

Select 'Yes' and you will revoke that user's sessions and log them out from all devices.

## Questions:

1. **Why are device compliance policies critical in Intune-managed environments? In your answer, describe how compliance policies enforce security baselines (e.g., minimum OS versions, encryption requirements, password complexity) and how Intune uses compliance state to automate remediation actions or block access to corporate resources.**

Device compliance policies are critical in Intune-managed environments because they establish and enforce security baselines. When creating compliance policies, the administrator can set the minimum OS version for a device to be enrolled. This is also a value that can be changed as later OS updates come out – dynamically providing a way for enforcing security. Compliance policies also control settings such as encryption requirements, password complexity, and actions for non-compliance.

There are device compliance policies that are for specific platforms, groups, users, or devices. There are also tenant-wide compliance policies that can apply to all groups, users, etc. Setting tenant-wide compliance policies can help to control remediation actions or block access to resources if devices or systems are non-compliant. By using appropriate discretionary settings at both levels, an administrator could comprehensively set a minimum standard for security for all members of an organization and specialize access, applications, settings, or restrictions to address the needs of individuals, groups, or platforms. This gives an administrator a great deal of options in using Intune to secure the network through these compliance policies.

<https://learn.microsoft.com/en-us/intune/intune-service/protect/device-compliance-get-started#how-intune-compliance-policies-and-azure-ad-conditional-access-work-together>

## **2. What strategic advantages does centralized application deployment via Intune offer compared to manual, per-device installations?**

Well, for starters, there is a huge convenience in creating policies and settings to allow for a centralized application deployment as opposed to manually installing software on a per-device basis. Being able to create different policies and groups based on departments, roles, and functions can greatly reduce the manual process by making it as easy as adding a user to a group rather than manually install software for every single user's device.

**Explain how deploying the Microsoft 365 suite (or other line-of-business apps) through Intune simplifies version control, licensing compliance, and update management.**

Coupled with the compliance settings, providing application deployments through Intune can ensure that devices stay up-to-date in order to remain compliant. This allows administrators the flexibility to update requirements by changing policies rather than 'auditing' every user's device to ensure that services or applications are up to date. This also allows everyone to have the same version of software, stay compliant with security policy, and therefore eliminates differences in software versions, reducing (if not outright eliminating) problems with version control.

**Quantify or qualitatively compare the administrative overhead (e.g., time per device, help-desk tickets, rollout coordination) between Intune-driven deployments and traditional "walk-around" or script-based installations.**

Intune-driven deployments may require some planning and discussion time up front to determine policies, compliance, and how often to update them. Still, this overhead is much smaller than what it would take for an IT department to manual deployments. Being in the cloud, it immediately eliminates any travel time to individual desks. It also vastly reduces the manpower required, as with a manual installation, you would require one tech per computer. Now, with Intune, you need one administrator for ALL devices. Even scripts would have to be run manually, whereas an Intune deployment would be practically automatic. No matter how you quantify it, using Intune to automatically deploy application installation will vastly save on time, resources, and man-hours that used to be required with manual installations.

## **3. How do user and device security groups in Intune improve policy targeting and administrative efficiency?**

**Illustrate with examples how grouping by role (e.g., "Sales\_Users") or by hardware type (e.g., "Surface\_Pro\_Devices") allows you to assign different**

**compliance rules, configuration profiles, or app deployments without repeating settings for each individual.**

User and device security groups in Intune allow administrators to create a few policies once and then apply them broadly to multiple users across their organization. By organizing security groups in this way, administrators can create specialized profiles that will apply to role-specific or department-specific actions, access requirements, applications, and security settings. For example, an administrator could create a group called Sales\_Users that would allow any existing or future employee in sales to have the same access to group resources (Teams, SharePoint Sites, files, applications) as all other sales people. This could also ensure that they don't have access resources that they don't need, such as financial information, marketing mock-ups, or IT spreadsheets. It also allows for administrators to more efficiently assign policies to broad numbers of users rather than having to manually update each individual's security settings. This makes creating targeted policies efficient and eases the 'grunt work' of administrative tasks.

**Describe how dynamic group membership rules or assigned/static membership impact ongoing management as employees join, leave, or change devices.**

Establishing dynamic group membership rules allow for users to easily be added or removed from security groups and therefore security policies. As employees join or leave groups or even change devices, enrolling them or their devices into new groups, removing them from groups, or switching them from one device to another becomes a much easier task. You can easily add or remove members from groups as well as have them sign into new devices and allow for the Intune automatic enrollment to run its course. This allows the process of dynamically moving an employee around to different groups much more smooth than manually changing settings for their account or device. This also gives organizations a great deal of flexibility and speeds up the onboarding or offboarding process significantly. In fact, coupled with Entra, this could allow administrators to remove users from a security group and/or specific access to resources practically immediately.

**4. Walk through the process of creating and assigning a Device Configuration Profile for Microsoft Edge extensions.**

**Include a step-by-step outline of how to locate the Settings catalog, add the "Control which extensions are installed silently" setting, retrieve an extension's App ID from the Microsoft Edge Add-ons store, and scope the profile to a device group.**

In Intune, you can create a Device Configuration Profile for Microsoft Edge Extensions. First, you need to click on Devices, then click on Configuration, and then Create.

Then you should choose Windows 10 and later for the Platform and then Settings catalog for the Profile type.

Here you can see the Settings catalog in the create profile process.

By clicking add settings, you get to the settings picker. Typing in ‘edge’ gives you a myriad of options, but if you scroll down, you eventually get to Microsoft Edge\Extensions. This is where you want to be.

Here, the settings are all sorted alphabetically. You can scroll down to the C’s and find the ‘control which extensions are installed silently’ setting. Toggle it to add this setting.

Third, to retrieve an extension’s App ID from the Microsoft Edge Add-ons store, you simply go to the Microsoft Edge store (<https://microsoftedge.microsoft.com/addons/Microsoft-Edge-Extensions-Home>) and select an extension.

For example, the Grammarly extension’s website has the following URL:

<https://microsoftedge.microsoft.com/addons/detail/grammarly-ai-writing-and/cnlefmmeadmemmdciolhbnfeacpdfbkd>

The last part of the URL, after the final forward slash, is the App ID. For Grammarly, the ID is “cnlefmmeadmemmdciolhbnfeacpdfbkd”.

Within the configuration settings, if you enable the setting you chose earlier, you can add the App ID of the extension. Above you can see that I added the Grammarly extension ID.

Finally, to scope the profile to a device group, you have to click next, which brings you to scope tags. Then you hit next again to Assignments. Here, you can add a group, like I did below:

Then you create the policy and you're finished!

Here you can see the policy is available in the Configuration section of Devices in Intune.

Here is the confirmation that the policy was deployed to my VM

And here is the Grammarly extension installed into Edge on my VM.

Source:

<https://learn.microsoft.com/en-us/deployedge/microsoft-edge-policies#extensions>
