

Juan Pablo de Legarreta
NETC-240
Lab 10
3-26-2025

Part 1

1. Using either M365 tenant (college or netc240.org) open office.com and log in. Create a Microsoft Form that will capture information for a trouble ticket for an IT helpdesk. Users will fill out the trouble ticket.

Logged into Microsoft Forms with my Cincinnati State Account.

- a. Consider what information you would include in the ticket. Provide at least 5 items that you would collect. For each item share your rationale for the specific information requested.

As I thought about IT helpdesk ticket information, I thought that the following information would be important.

I would collect:

- I. Identifiable information
 - a. I would collect the person's name, contact information, and information about their device
 - b. This is important information because the form might capture contact information if the person is logged into a Microsoft account, but this is not guaranteed.
- II. Time information
 - a. Date and time of the ticket itself and when the issue started as well as best time to contact person
 - b. This would be important in order to track response time and also to get a sense of how long the issue has been going on – this might determine priority of issues and availability of technicians
- III. Information about the issue itself
 - a. An explanation of what the problem is and what the person has tried already to mitigate/fix the issue

- b. This would be important to understand where to begin the troubleshooting process as well as get an understanding of what is happening.

The screenshot shows the Microsoft Forms editor interface for a form titled "IT Helpdesk Ticket". The form is in "Saved" status. The top navigation bar includes "Style", "Settings", "Preview", and "Collect response" buttons. On the right, a user profile for "De Legarreta, Juan P" is visible, with email "jpdelegarreta@cincinnati...". The form content includes a title, a description, and three required questions: "1. Name", "2. Phone number", and "3. Email address". Each question has a text input field with the placeholder "Enter your answer". A left sidebar shows a "Templates" button.

Having considered what types of questions I would ask on the form, here are the first three questions of the IT Helpdesk Ticket form, mostly about contact information. There are 10 questions total, please feel free to review them!

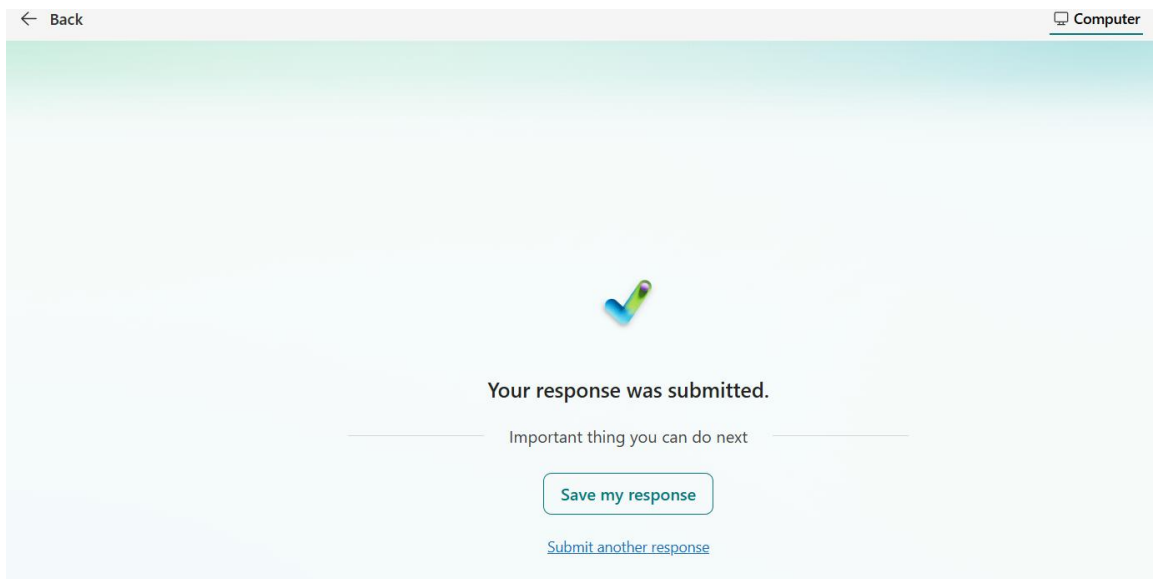

The form can be seen at the following link:

<https://forms.office.com/Pages/ResponsePage.aspx?id=qGtLS4ZRCU25soyV9ynEsvIikktXFAVFuTRWW7Wh5gRUMlgyWVgyOTlXMzQyMjE4MkNVSkdUVDYyVC4u>

b. Test the Form to verify proper operation

This screenshot shows the form during a test submission. The title "IT Helpdesk Ticket" is at the top. Below it is the instruction: "Please answer the following questions and an IT representative will help you as soon as they are able." A personalized message follows: "Hi, Juan. When you submit this form, the owner will see your name and email address." A legend indicates that an asterisk (*) denotes a required field. The first question, "1. Name *", has a text input field containing "Juan Pablo de Legarreta". The second question, "2. Phone number", has an empty text input field with the placeholder "Enter your answer". The third question, "3. Email address *", has a text input field containing "jpdelegarreta@cincinnati...edu".

I clicked the Preview button and got to this example form. I am populating the form with my own information and a made up issue to be submitted.

Here are the responses with some data! The form seems to be working perfectly.

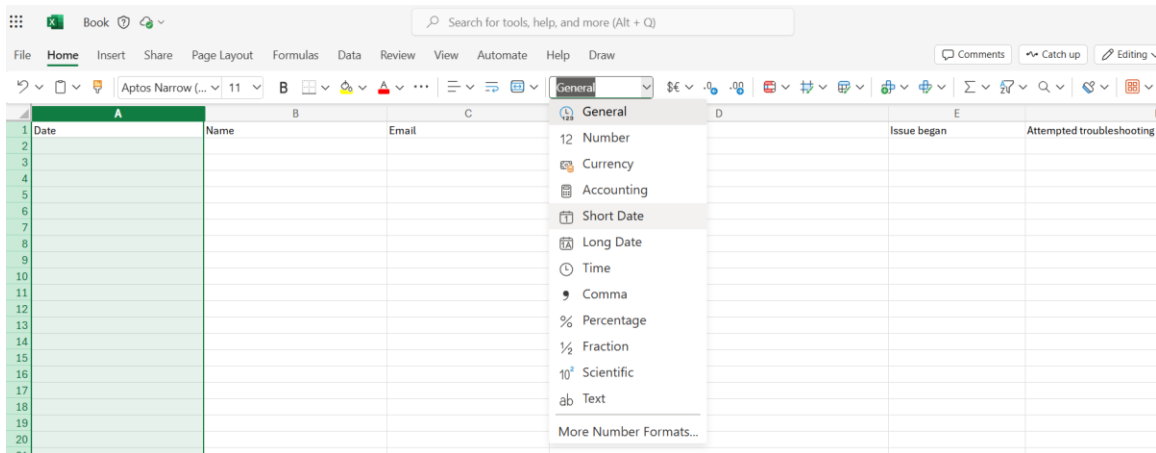

Part 2

1. Follow the Power Automate Demo video and create the same Flow. This Flow will extract the information from the submitted form and add a row to an Excel file
2. Create the Excel file
 - a. Enter column headers

	A	B	C	D	E	F
1	Date	Name	Email	Issue	Issue began	Attempted troubleshooting
2						
3						
4						
5						
6						
7						
8						
9						
10						
11						
12						

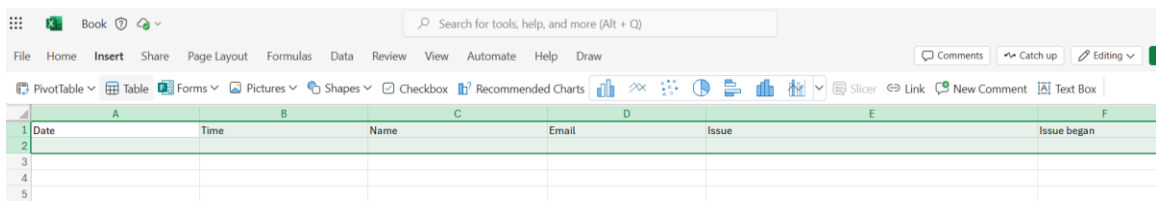

I have started an excel spreadsheet with columns that loosely align with the IT helpdesk ticket form that I created earlier.

- b. Set the column data type for each column (i.e. date, text, etc.)

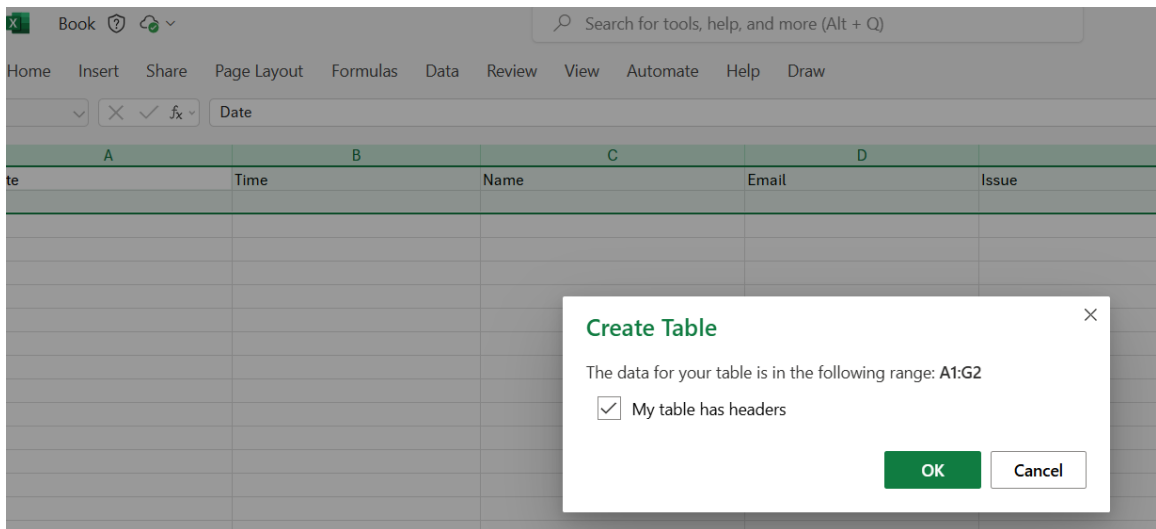

Here I am choosing the data type for the Date column and I will chose a type for each one.

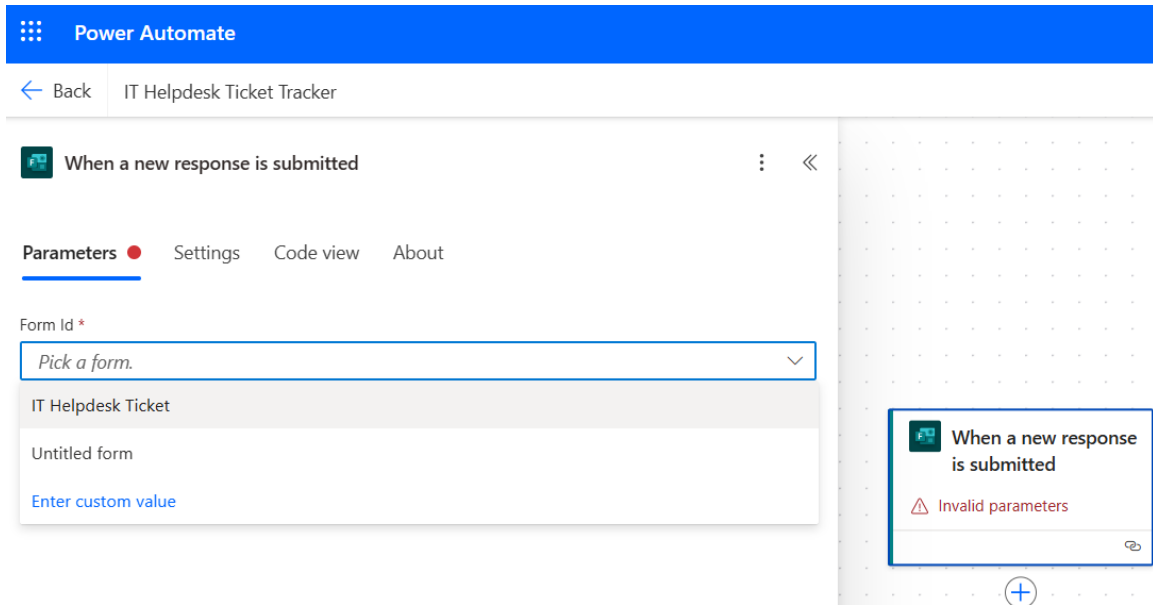

c. Create a table from the selected area

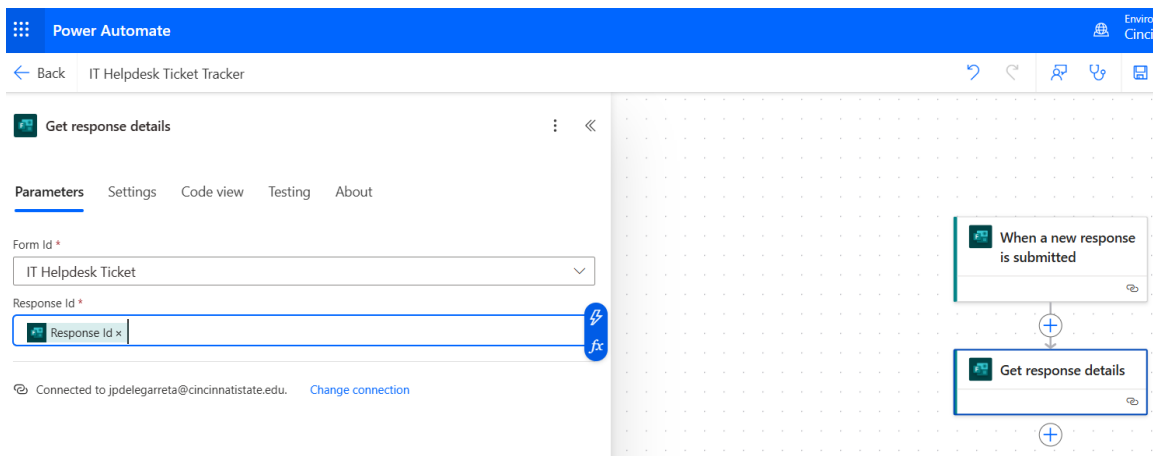

Here I took the first two rows and selected Insert > Table.

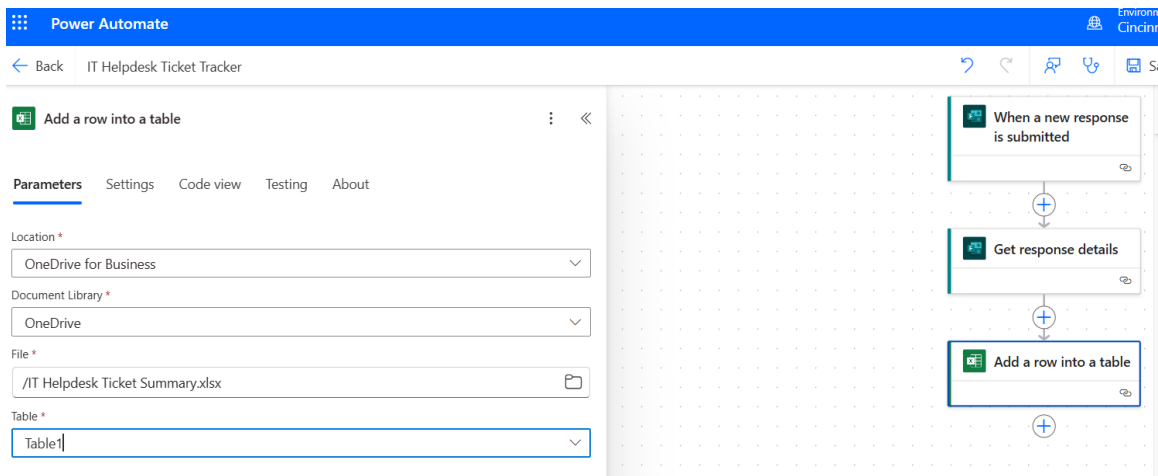

I click the option to include the first row as headers and click ok.

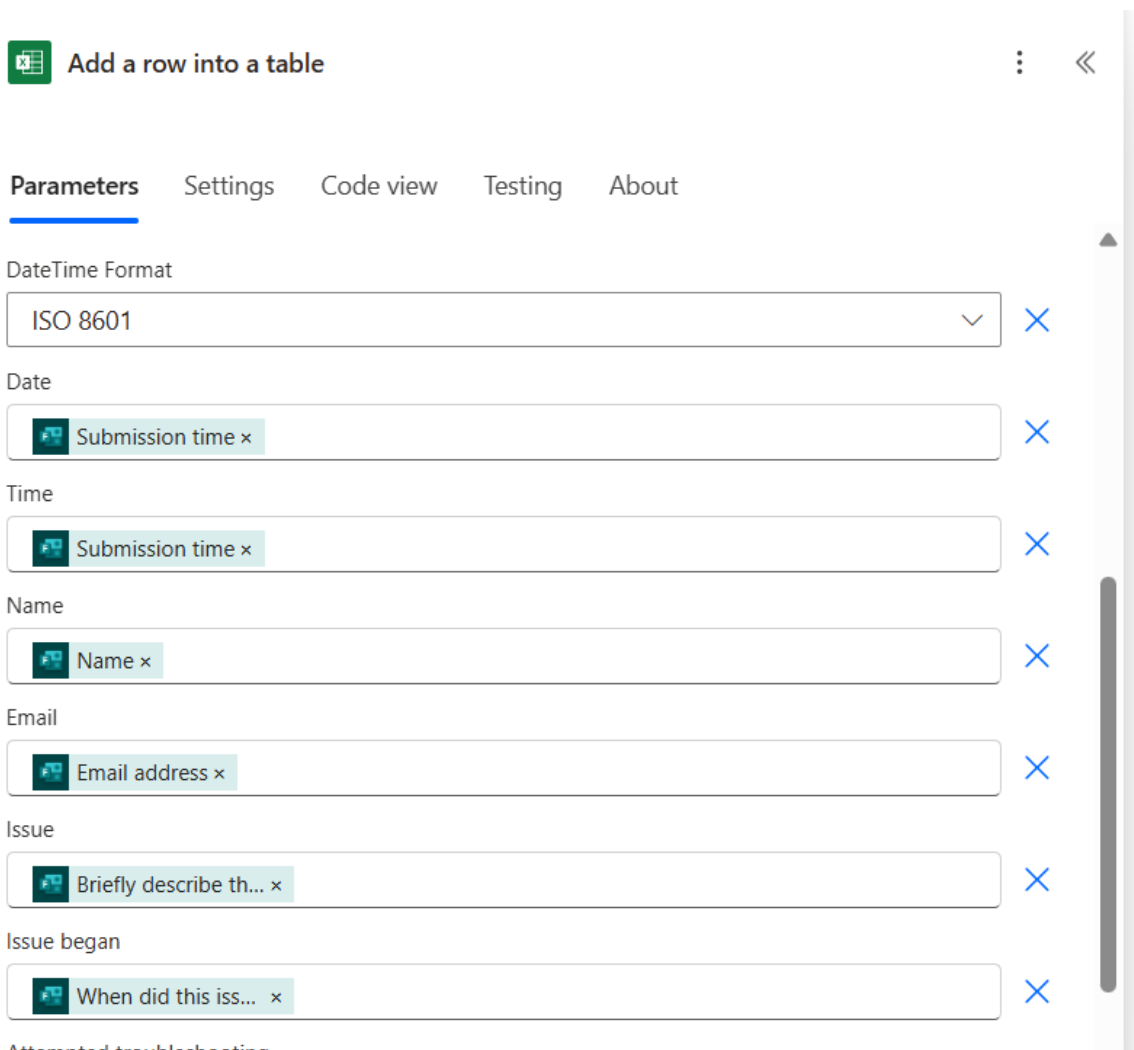

Here I am selecting the IT Helpdesk Ticket Form to satisfy the 'Invalid parameters' Error message.

I added the 'get response details' part of the Flow and selected my form and the Response ID from the lightning bolt.

I added the 'add a row into a table' step in the Flow with the relevant information for my Excel sheet that I created earlier.

Here are the connected fields between the excel sheet and the Form.

4. Save the Flow

5. Test the Flow by submitting two forms

a. One submission should be from you F3 account

← Back Computer

IT Helpdesk Ticket

Please answer the following questions and an IT representative will help you as soon as they are able.

Hi, Juan. When you submit this form, the owner will see your name and email address.

* Required

1. Name *

James

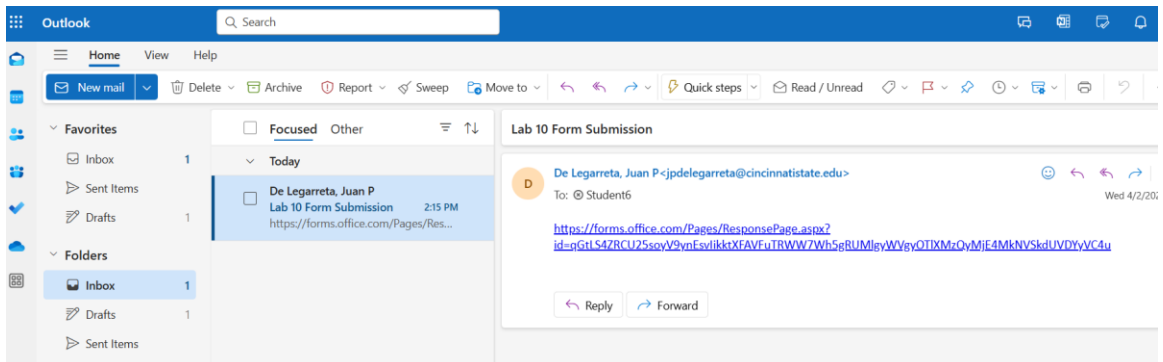

2. Phone number

5155556989

3. Email address *

james@james.com

Started a submission with random bogus information above.

I emailed the form to my F3 account, student6@netc240.org.

IT Helpdesk Ticket

Please answer the following questions and an IT representative will help you as soon as they are able.

- Name ***
- Phone number**
- Email address ***

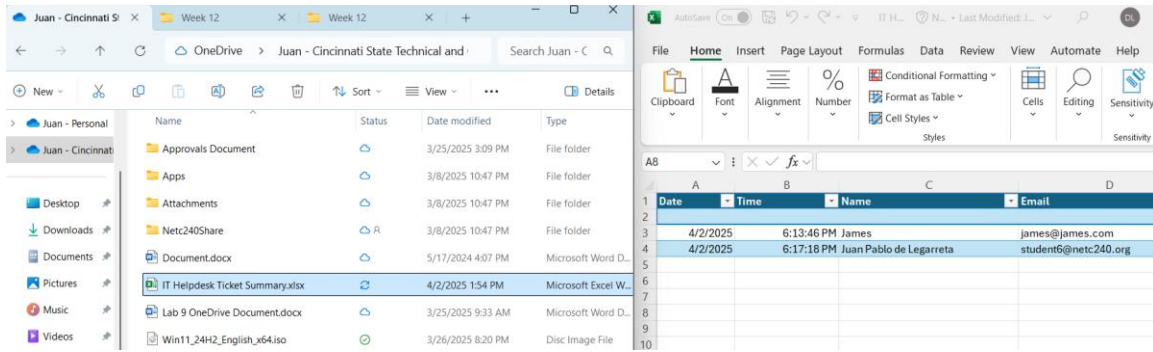

I had to change the settings of the form to allow people outside of the organization to access/fill out the form. Afterwards, I filled out the form from my F3 account.

6. Show the updated contents of the Excel table

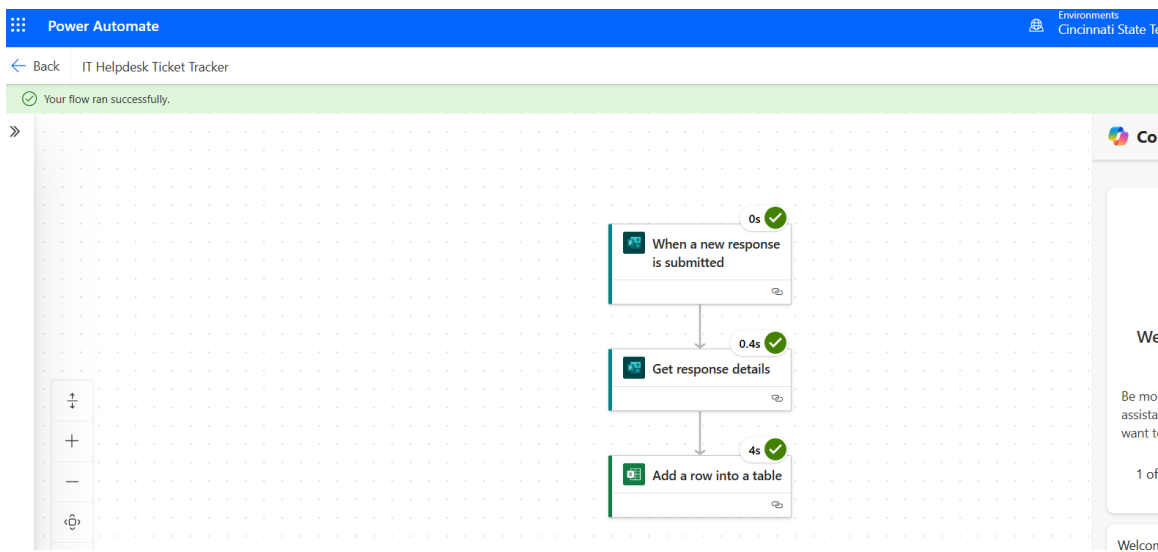

Date	Time	Name	Email	Issue	Issue began	Attempted troubleshooting
4/2/2025	6:13:46 PM	James	james@james.com	I can't open my laptop	3/31/2025	I tried opening it. That's it. It won't work.
4/2/2025	6:17:18 PM	Juan Pablo de Legarreta	student6@netc240.org	I'm having trouble booting up my Kali Linux VM for some reason.	4/1/2025	I tried to change the settings to no avail. Please send help

Back in the Excel sheet, we can see that the contents of the form have been put in!

7. Open your OneDrive folder and show that the trigger successfully ran

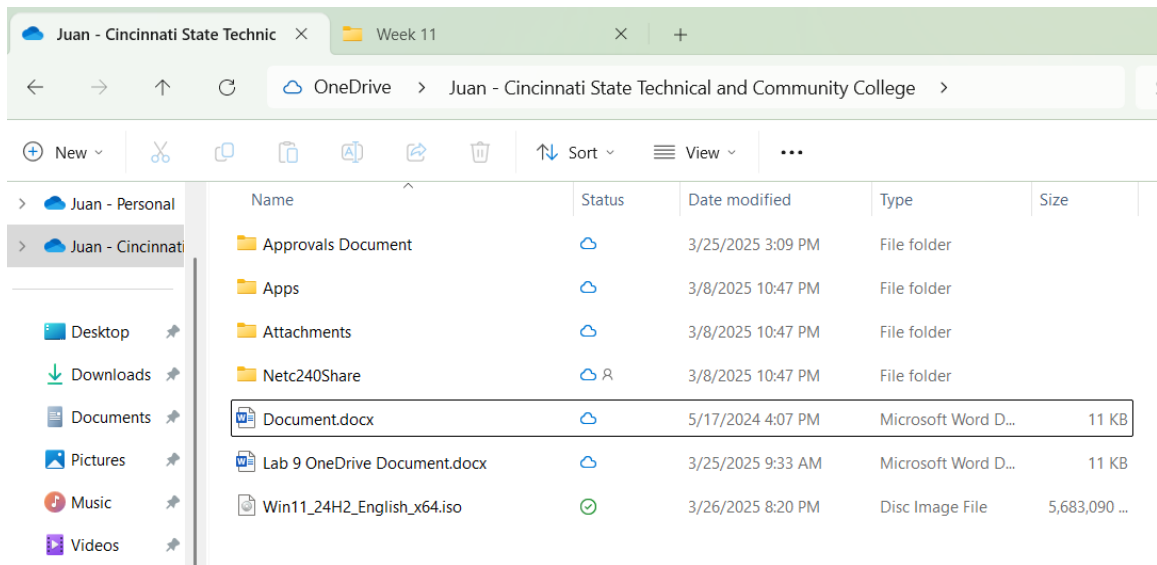

Here's a side-by-side comparison of the Excel sheet in my college OneDrive and the downloaded Excel file from OneDrive. It looks like the trigger worked perfectly!

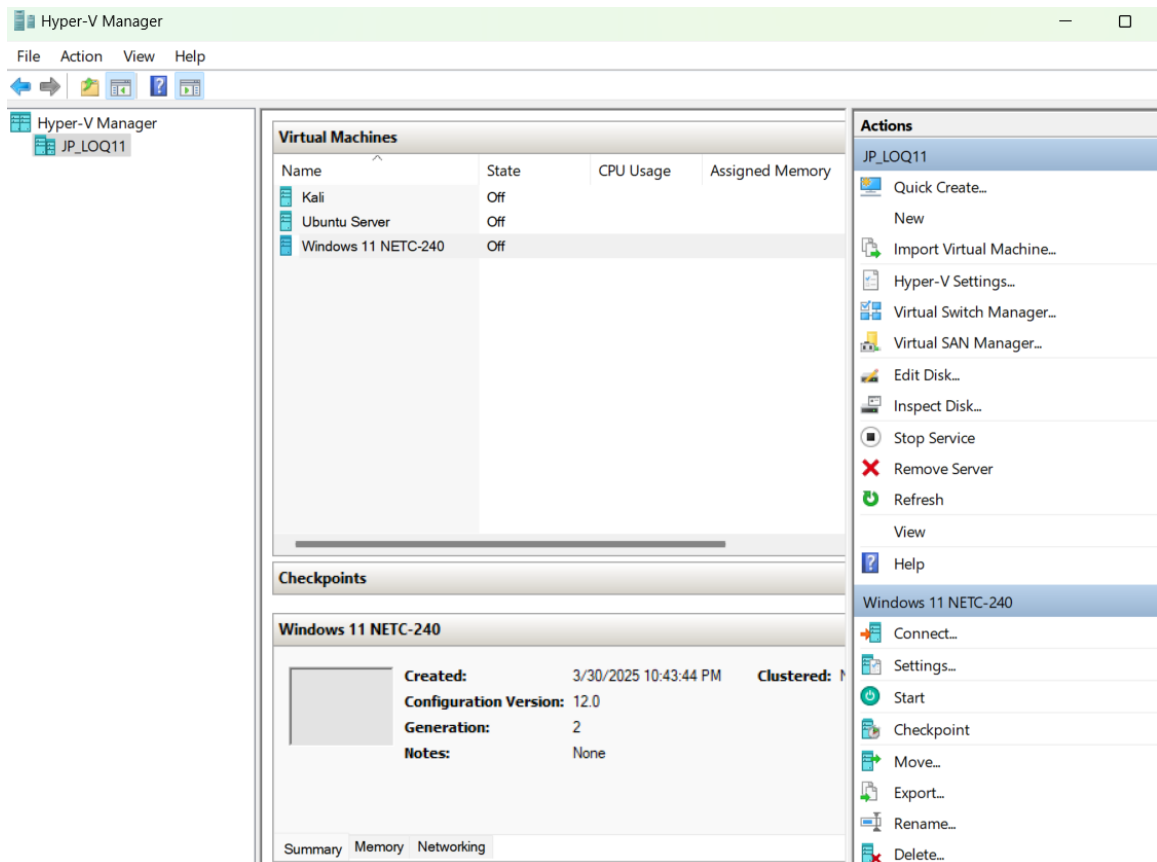

Back in Power Automate, you can see that the flow ran successfully!

Part 3. Your Windows 11 VM will be enrolled in Intune. You are welcome to run the VM in our lab, on your laptop or at home.

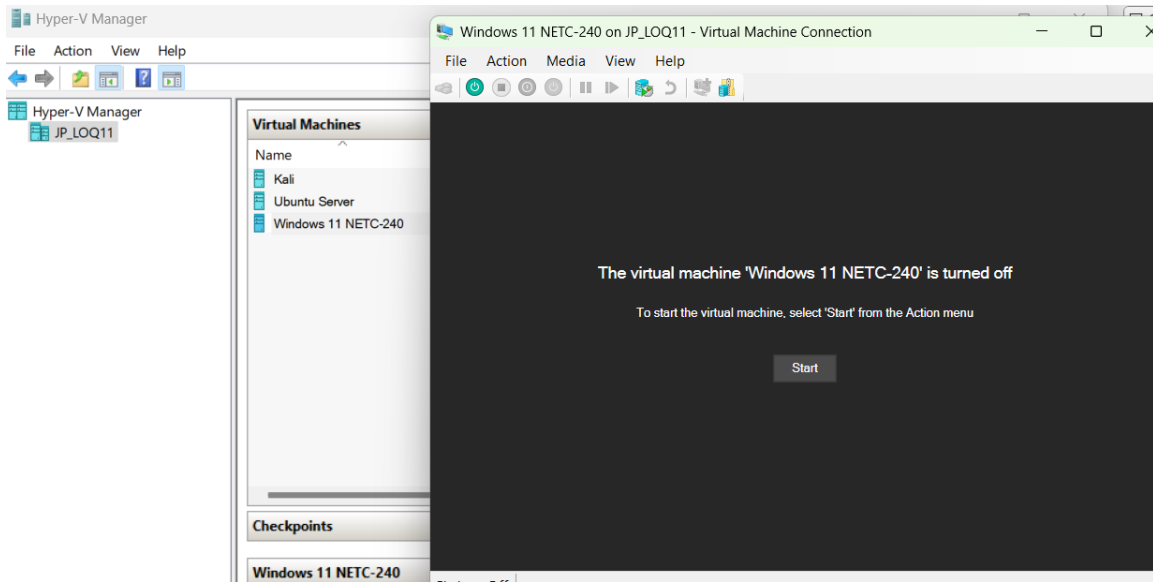

1. Create a standalone Windows 11 VM.

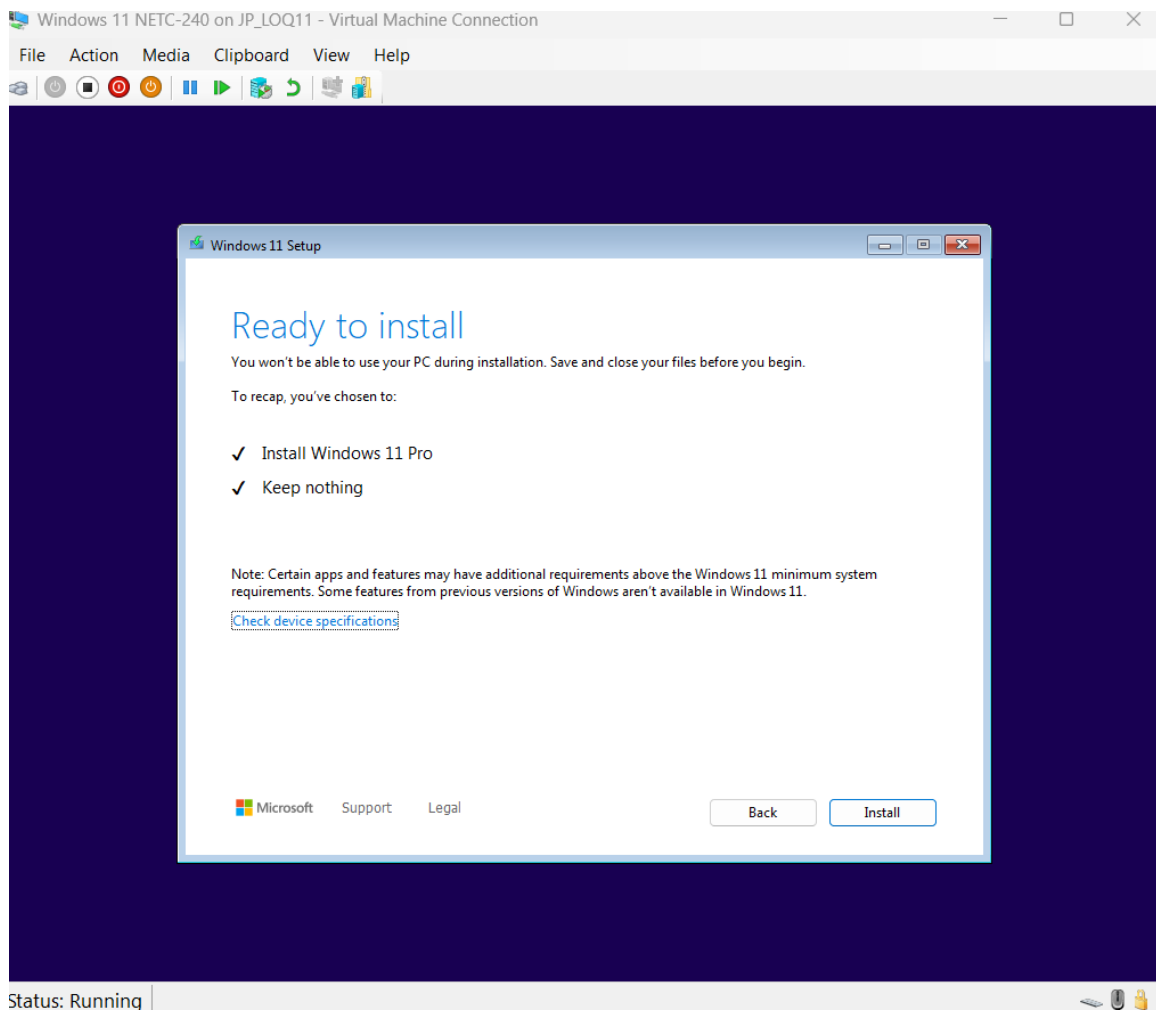

I copied the Windows 11 iso file into my College OneDrive, seen above, to use with Hyper-V on my computer to spin up a Windows 11 VM.

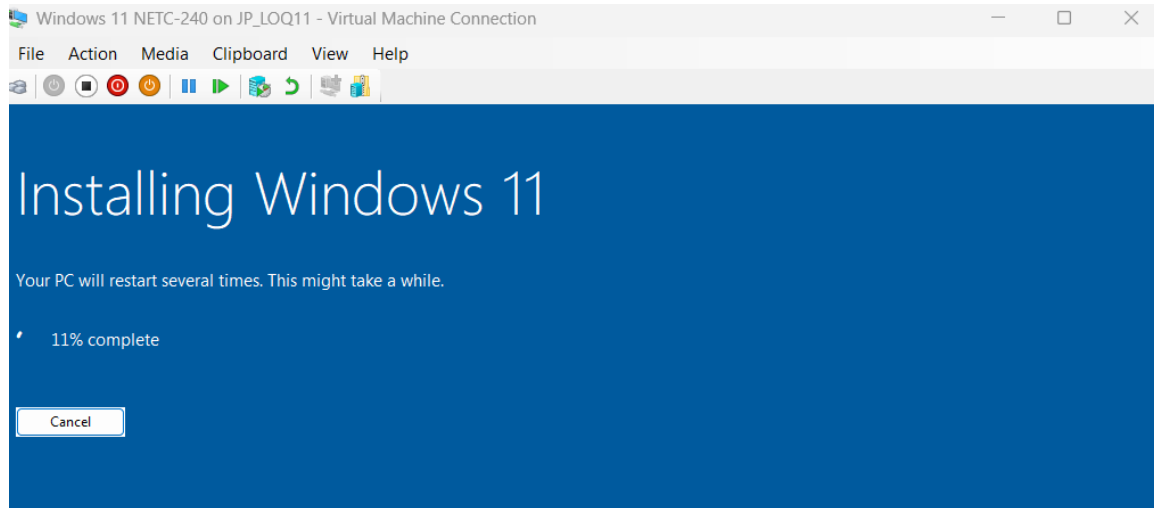

Here you can see that the Windows 11 VM was created on Hyper-V, and it needs to be booted to start the update process.

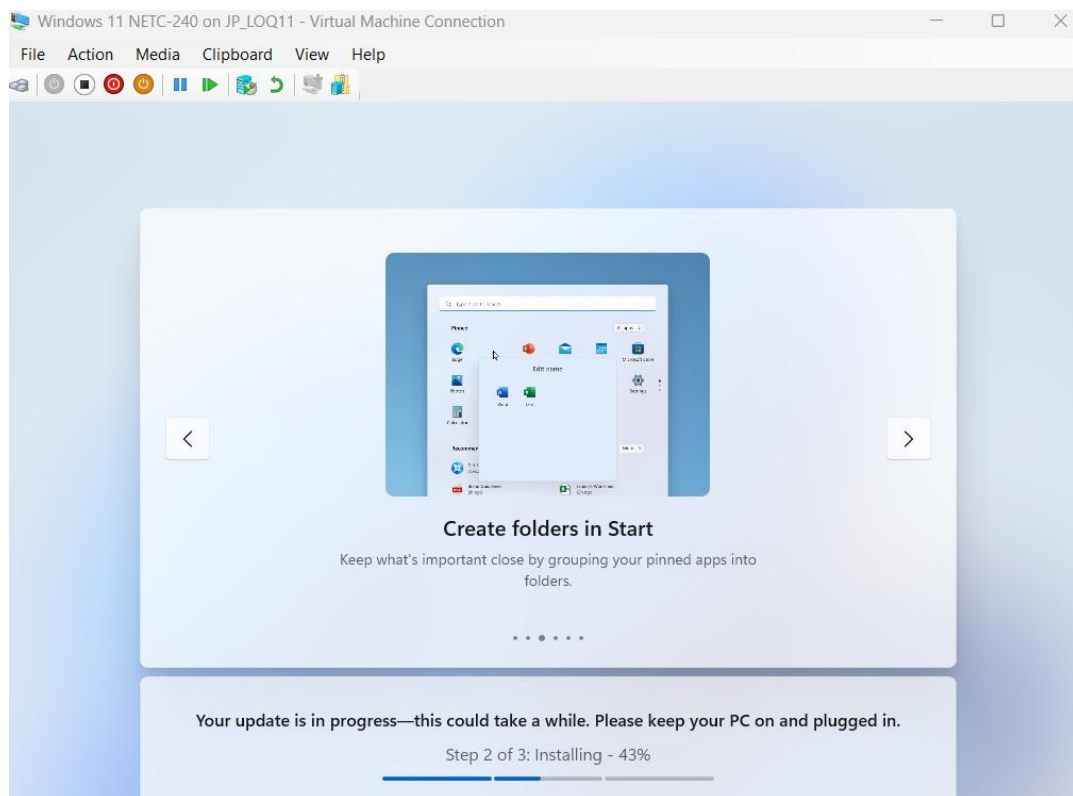

Connected to the VM, which needs to be turned on.

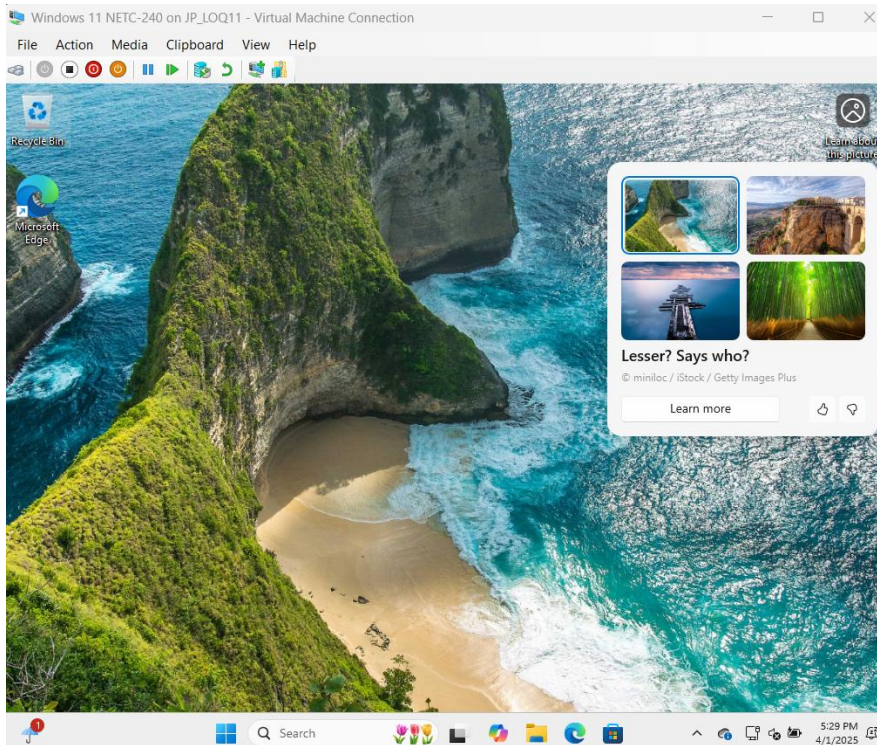

Turned the VM on and started the installation process.

The installer is running, and the VM is being created.

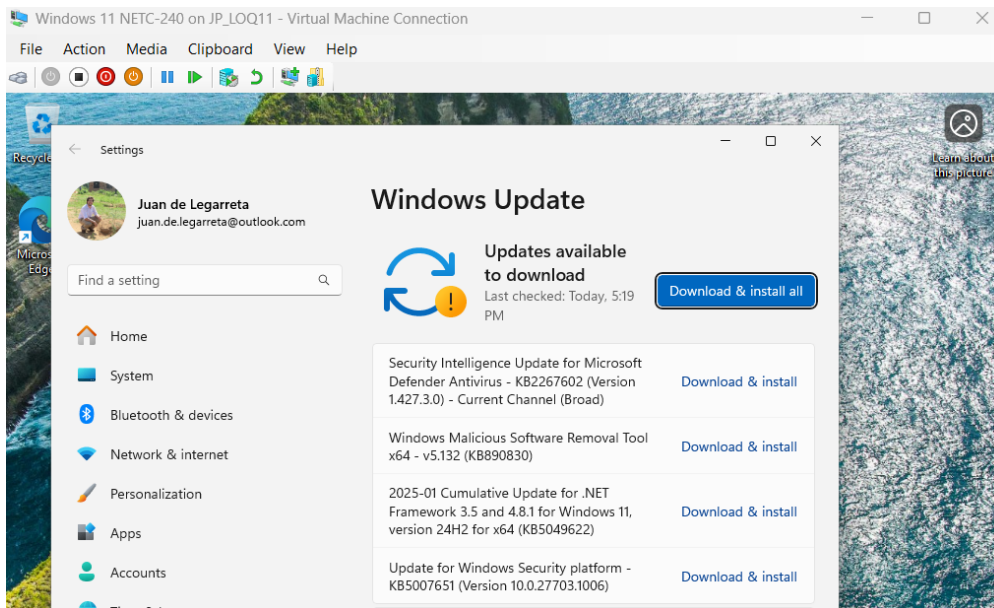

Here, the installer is fetching Windows updates.

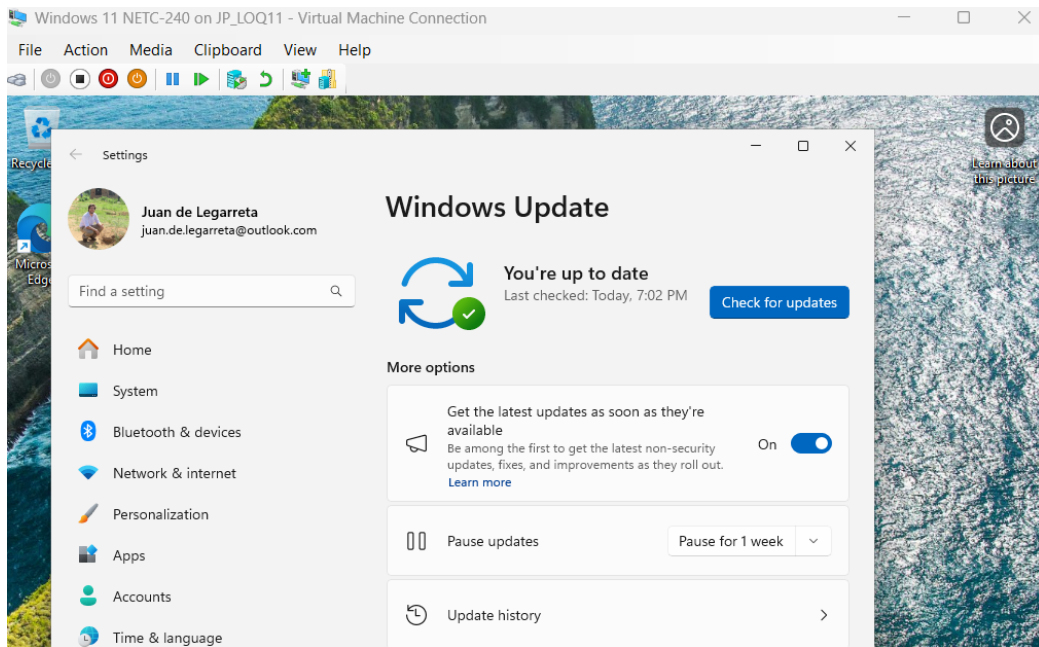

Here is the desktop of the VM running on my PC.

- a. **Run Windows update, update the PC, reboot and repeat until there are no more updates**

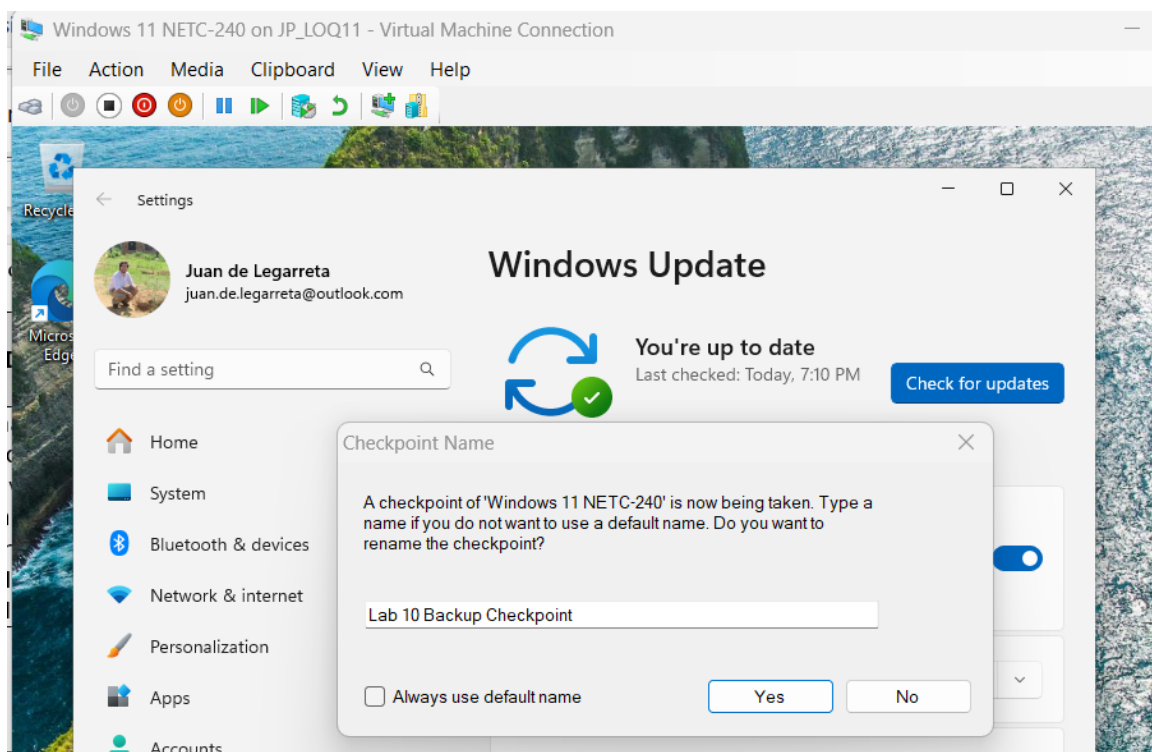

Here you can see updates are required. I am going to install them all now.

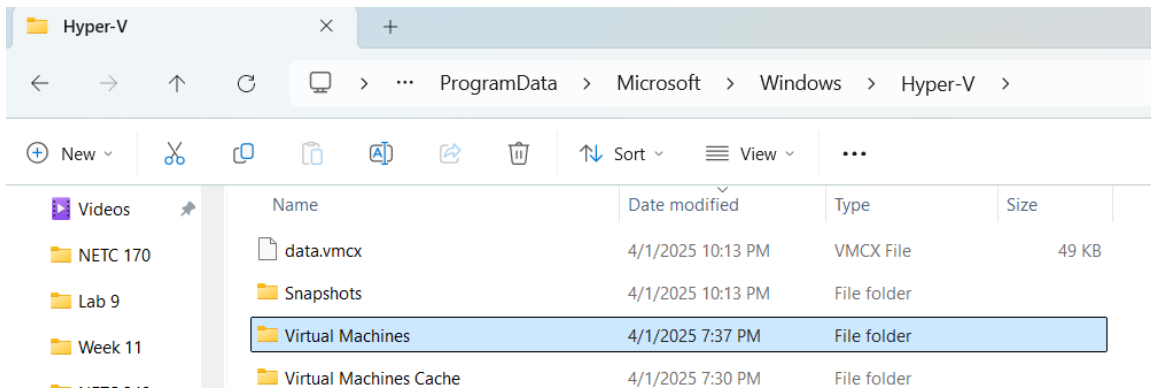

After updating and restarting 4 times, there are no more Windows updates!

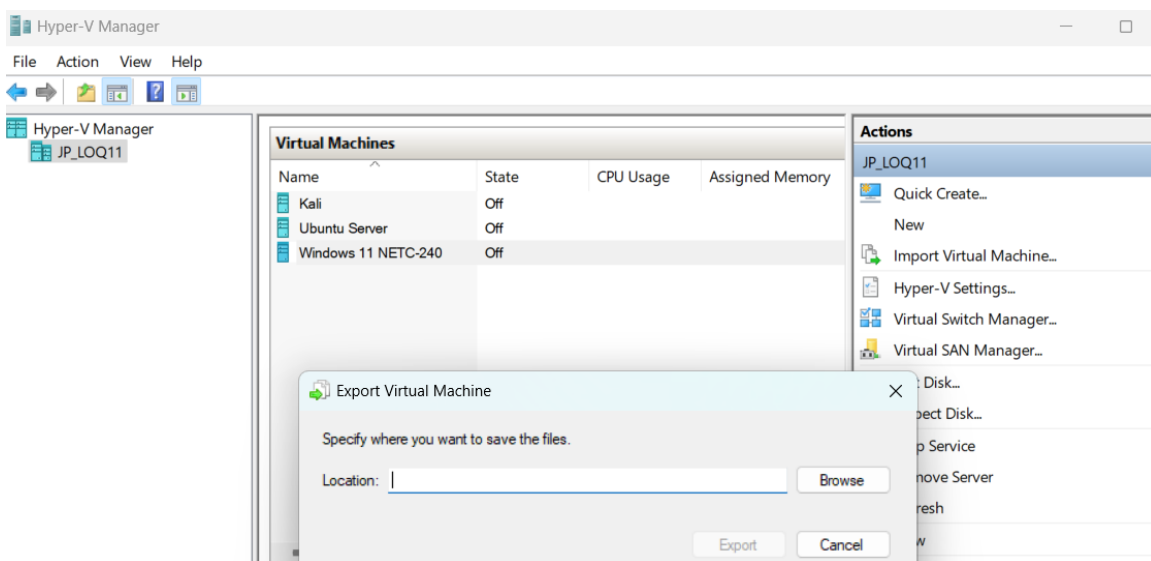

b. Backup your finished VM

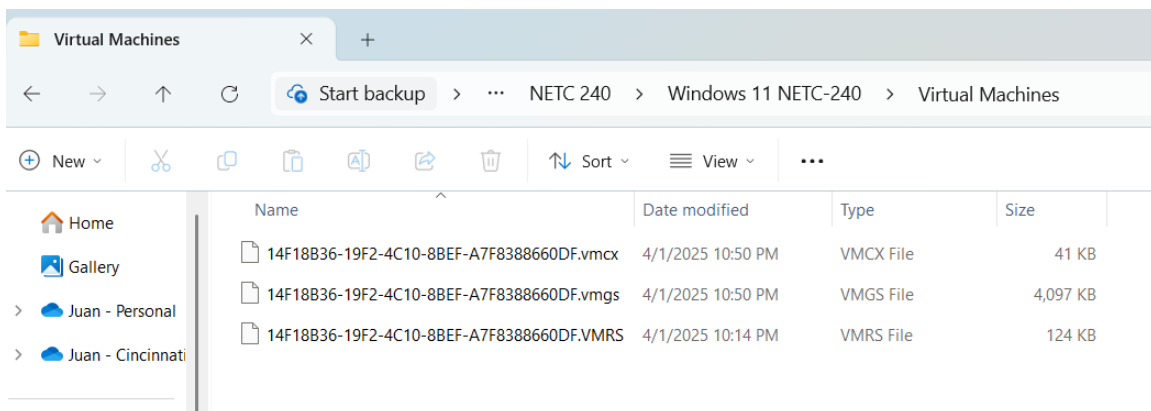

Here I am creating a checkpoint of the machine at its current state.

Here you can see the checkpoint that I created for the VM.

Additionally, I am exporting the VM to create a full backup on my PC.

You can see the VM is stored in this folder as the vmgs file, and below you can see that I can import the file to Hyper-V to create a new VM from the original exported Windows 11 VM.
